

Credit Card Financial Analysis Dashboard

Using SQL & Power BI

Presented by: Suryavhi Das

Objective

Analyze credit card transaction and customer data to identify revenue trends, customer behavior, and business opportunities using interactive dashboards.

Project Overview

Problem Statement

Financial institutions generate large amounts of transaction data, making it difficult to identify customer spending patterns and revenue opportunities.

Solution

Developed two interactive Power BI dashboards using SQL-processed data to monitor KPIs and generate actionable business insights.

Technologies Used

SQL

Power BI

DAX

Data Modeling

Data Visualization

Dashboard 1 – Credit Card Transaction Report

- Total Revenue & Interest Earned
- Transaction Amount & Count
- Revenue by Card Type
- Revenue by Expenditure Type
- Revenue by Education Level
- Revenue by Customer Profession
- Quarterly Revenue & Transaction Trend

Dashboard 2 – Credit Card Customer Report

- Revenue by Gender
- Revenue by Income Group
- Revenue by Age Group
- Revenue by Education Level
- Revenue by Marital Status
- Revenue by Personal Loan
- Top 5 Revenue Generating States

Business Insights

Blue Card Dominance

Blue Card customers generated the highest revenue (~46M).

Top Spending Categories

Bills and Entertainment were the top spending categories.

Customer Profession

Business professionals contributed the highest customer revenue.

Income & Education

High-income and graduate customers generated the maximum revenue.

Digital Payment Opportunity

Swipe transactions were much higher than online transactions, indicating an opportunity to promote digital payments.

Business Recommendations

- Launch loyalty programs for Blue Card customers.
 - Offer cashback on Bills, Fuel, and Entertainment spending.
 - Promote online transactions through discounts and rewards.
 - Target high-income customers with premium credit card offers.
 - Focus marketing campaigns on top-performing states to maximize revenue.
-

Conclusion

This project demonstrates how **SQL** and **Power BI** can transform raw financial data into interactive dashboards that support **data-driven decision-making**, improve customer segmentation, and help organizations identify opportunities for revenue growth.
